

AI Usage Reflection

Prompts Used

1. I have attached my existing README.md file. Rephrase and format the README.md to follow industry standards and make it professional. I want it to be a clean and standard markdown file. Keep the titles as it is, just alter the content.
2. Create a test script to validate the error-handling functionality of the clean script.

ERROR	EXPECTED OUTPUT
1) No input file specified	ERROR: No input CSV file provided
2) Input file not found in the current directory	ERROR: Input file not found in the current directory
3) Input file is not a CSV file	ERROR: Input file expected in a CSV format
4) Input file is empty	ERROR: Empty file provided
5) Input CSV file has incorrect number of fields in the header	ERROR: Expected 7 columns in the header
6) Input file contains no data rows apart from the header	ERROR: No data rows found in the input file

3. Create a test script to validate the error-handling functionality of the analyse script.

ERROR	EXPECTED OUTPUT
1) No input file specified	ERROR: No input CSV file provided
2) Input file not found in the current directory	ERROR: Input file not found in the current directory
3) Input file is not a CSV file	ERROR: Input file expected in a CSV format
4) Input file is empty	ERROR: Empty file provided
5) Input CSV file has incorrect number of fields in the header	ERROR: Expected 6 columns in the header
6) Input file contains no data rows apart from the header	ERROR: No data rows found in the input file

4. I would like to continuously test every script. Can you write a GitHub Actions YAML workflow to test and analyse scripts on every push and pull_request, including execution of tests/test_clean and tests/test_analyse.

5. Can you update the current test files - clean & analyse? I have attached them. Check if they cover the following scenarios:
 - All edge cases
 - Delete the ratings_disabled column
 - Remove rows with inconsistent column counts
 - Remove duplicate rows
 - Remove rows with empty fields
 - Remove rows with zero likes or dislikes
 - Remove time from publish_date
 - GitHub Actions automation support
 - Tie-breaker scenarios with comma-separated outputs
 - Negative views, likes, and dislikes
 - Mean zero and division-by-zero cases
 - Minimal dataset cases
 - Maximum dataset and stress/performance testing cases
6. Correct the grammar, syntax and wording of the comments added in the clean and analyse scripts attached. Keep the comments short, precise and professional.
7. I want to print multiple records whenever there is a tie between videos for all fields. Currently, I am storing only a single value in the array. Is it possible to store multiple values and later split them using a key similar to Python dictionaries? Is there any equivalent approach or function in AWK to handle this more efficiently?
8. Review my AWK logic attached and suggest cleaner ways to handle repeated conditions, array usage and tie-case outputs while keeping the script readable and maintainable.
9. Mention which would be the better approach to remove time from publish_date. Using sed, cut or gsub? Elaborate with examples.
